Date: September 19, 2026

**ONLINE ACTIVITY #2**  
Personalized Linux, and Git Cheat Sheet

Using any available resources (official Git documentation, online tutorials, or the built-in git --help command), research the following topics and create a personalized 1-page (A4) cheat sheet:

1. Basic Linux commands (command, sample usage) (at least 10)
2. Basic Git commands (command, sample usage, description (use your own wordings), common options/flags

|            |                           |
|------------|---------------------------|
| git init   | git restore               |
| git status | git branch                |
| git add    | git checkout / git switch |
| git commit | git merge                 |
| git log    | git tag                   |
| git diff   | git clone                 |

3. the three-tree architecture of Git

You are free to use any design or color scheme, just make sure it is readable.

Submission:

1. Use PDF as the file format for your cheat sheet.
2. Upload it to your GitHub repository
3. Submit the link here:  
<https://drive.google.com/drive/folders/1-Y6e6E6PoLyGgB0WZ8prRCNfolpV3cj0?usp=sharing>

**Reminders:**

Please put a "Reference" section in the cheat sheet for the materials you cited.

I **DO NOT PROHIBIT** the use of AI for this activity, but please declare the extent of the use.

Sample:

*"The author used [Tool Name, Version] to [specific task] during assignment preparation. The author reviewed and edited the content as needed and takes full responsibility for the final content of the work."*

Or

*"I have not used any AI or AI-assisted technologies to prepare this work."*

**ONLINE ACTIVITY #2**  
Personalized Linux, and Git Cheat Sheet

1. Basic Linux commands (command, sample usage) (at least 10)

| Command              | Purpose / Sample Usage                                        |
|----------------------|---------------------------------------------------------------|
| pwd                  | Show current working directory.                               |
| man git              | Open the manual page for a command.                           |
| cd ..                | Move up one directory level.                                  |
| history              | View previous terminal commands.                              |
| ps aux               | Display currently running processes.                          |
| clear                | Clear the terminal screen.                                    |
| find . -name "*.txt" | Search for .txt files by name.                                |
| ls -la               | List files with detailed information, including hidden files. |
| mkdir new-dir        | Create a new directory.                                       |
| free -h              | Display RAM usage in human-readable units.                    |
| cp file1 file2       | Copy a file.                                                  |
| mv old new           | Move or rename a file.                                        |
| rm file              | Remove a file.                                                |

2. Basic Git commands (command, sample usage, description (use your own wordings), common options/flags)

| Command    | Description / Sample Usage                  | Option |
|------------|---------------------------------------------|--------|
| git init   | Create a new Git repository.                | --bare |
| git status | Show staged, modified, and untracked files. | -s     |
| git add .  | Stage changes for the next commit.          | -A     |

|                      |                                         |            |
|----------------------|-----------------------------------------|------------|
| git commit -m "msg"  | Save staged changes in project history. | --amend    |
| git log              | Display commit history.                 | --oneline  |
| git diff             | Show line-by-line differences.          | --staged   |
| git restore file     | Restore a file to its last commit.      | -s         |
| git branch           | List, create, or delete branches.       | -a, -m, -d |
| git switch main      | Switch branches.                        | -c         |
| git merge branch     | Combine changes from another branch.    | --no-ff    |
| git tag              | Label a specific commit.                | -a, -m, -d |
| git clone <url>      | Copy a remote repository locally.       | --depth 1  |
| git remote -v        | Show configured remote URLs.            |            |
| git push origin main | Upload local commits to GitHub.         |            |
| git pull origin main | Fetch and integrate GitHub changes.     |            |

### 3. the three-tree architecture of Git

| Tree / Area                 | Description                                                            | Command    |
|-----------------------------|------------------------------------------------------------------------|------------|
| <b>Working Directory</b>    | The actual project files where you edit and make changes.              | git add    |
| <b>Staging Area (Index)</b> | A holding area for changes selected to be included in the next commit. | git commit |
| <b>Repository (.git)</b>    | Stores the permanent history of committed changes.                     | git push   |
